****NOTE:** All pumps can be incorporated into multiple pump configurations. Contact Sauer-Sundstrand for details and specifications.

Sauer-Sundstrand Gear Pump and Motor Features

- Worldwide sales and service capabilities from the industry leader is part of the package for every Sauer-Sundstrand gear product customer.
- Proven reliability with over 45 years of experience in gear product design for mobile and industrial applications.
- System pressures to 4000 psi (276 bar) and speeds to 8,000 rpm allow high performance in system design.
- Pressure balanced design for high efficiency and long life.
- Low cost design and manufacturing for the requirements of fixed displacement systems.
- Variety of flexible installation options available:
 - SAE, Metric, and European flanges, shafts and ports
 - Convenient side or rear porting options
 - Auxiliary through drive SAE mounting pads
 - Integral relief valve, priority flow control, and priority flow divider covers
 - High temperature viton seals optional
 - Multiple pump configurations (refer to the Quick Reference chart below)

A Complete Family of Sauer-Sundstrand Gear Pumps and Motors

Quick Reference - Displacement/Model

SNP3

The SNP3 series pump replaces the TAP2290 Series pump. The SNP3 offers an additional model in the range as well as higher volumetric and torque efficiencies due to improved machining techniques and a new pressure balance design. Peak pressure capabilities have been increased to 3910 PSI. The overall length of the SNP3 is 4.5 mm (.177 inch) longer than existing TAP2290 units and can be used in single or multiple pump combinations. Adapter kits used for multiple pump combinations are the same as those used with the TAP2290. There are no components required when changing rotation. The SNP3 range is available in 22.1 cm³ (1.35 in³) to 88.2 cm³ (5.38 in³) displacements.

SEP3

The SEP3 series pump is a cost effective alternative for applications not requiring the high pressure capabilities of the SNP3 or CP180 series. The SEP3 design utilizes a bearing block design without the floating pressure plates as on the SNP3. Overall efficiencies are similar to SNP3. However, pressure capabilities are reduced. The SEP3 range is available in 22.1 cm³ (1.35 in³) to 44 cm³ (2.69 in³) displacements.

Technical Features

DESIGN

Sauer Sundstrand gear pumps and motors utilize an external spur gear, positive displacement design of proven low pressure high efficiency. These high performance pumps are constructed of a three piece aluminum body which has been proven in over 30 years experience in hydraulic products for mobile and industrial applications. The extruded aluminum housing provides the necessary strength construction while providing a very high power to weight ratio and increased heat dissipation. Most importantly, the aluminum center section permits the gear teeth to inlet create their own path for maximum radial gear tip seal and high volumetric efficiency.

Figure 1:

PRECISE GEAR ALIGNMENT

Cast aluminum bearing blocks are fitted to the gear pockets for precise alignment. Since all parts are contained in the housing the possibility of misalignment is eliminated. The load is carried uniformly without stress being applied to either the end cap or the front cover. Teflon coated pressure lubricated bronze bushings in each bearing block ensure a long operating life.

ROBUST CONSTRUCTION

One piece gear/shaft construction provides both high strength and an accurate profile. Each integral gear/shaft is constructed of bearing quality hardened steel which is machined to precise tolerance for minimum leakage. The one piece design also eliminates the potential problems of stress fatigue often associated with two piece designs.

Figure 2:

LEAK PROTECTION

Standard are Buna seals to prevent leakage and migration of fluids from the hydraulic circuit to the gear box or atmosphere. Viton Shaft seals are available.

Technical Features, Continued

PRESSURE BALANCE

Pressure balance plates on each side of the gears contribute to high volumetric efficiency and maximum seal on all SauerSundstrand pump and motor models.

The TFP100 and SNP2 models are each equipped with thick pressure plates which function as part of the bearing block. The SNP3 has thin pressure plates which provide high efficiency at both low and high speed for maximum efficiency throughout the speed range. See Figure 3.

Accurately defined pressure zones at the rear faces of the bearing blocks receive oil under pressure which loads the bearing against the gear side face. Contact force between bearing face and gear is low and precisely controlled across wide speed, pressure and temperature ranges. The result is typical volumetric efficiencies in the range of 95% through effective sealing between gear and bearing faces—without causing undue wear or overheating between these faces.

In order to prevent pressure trapping in between

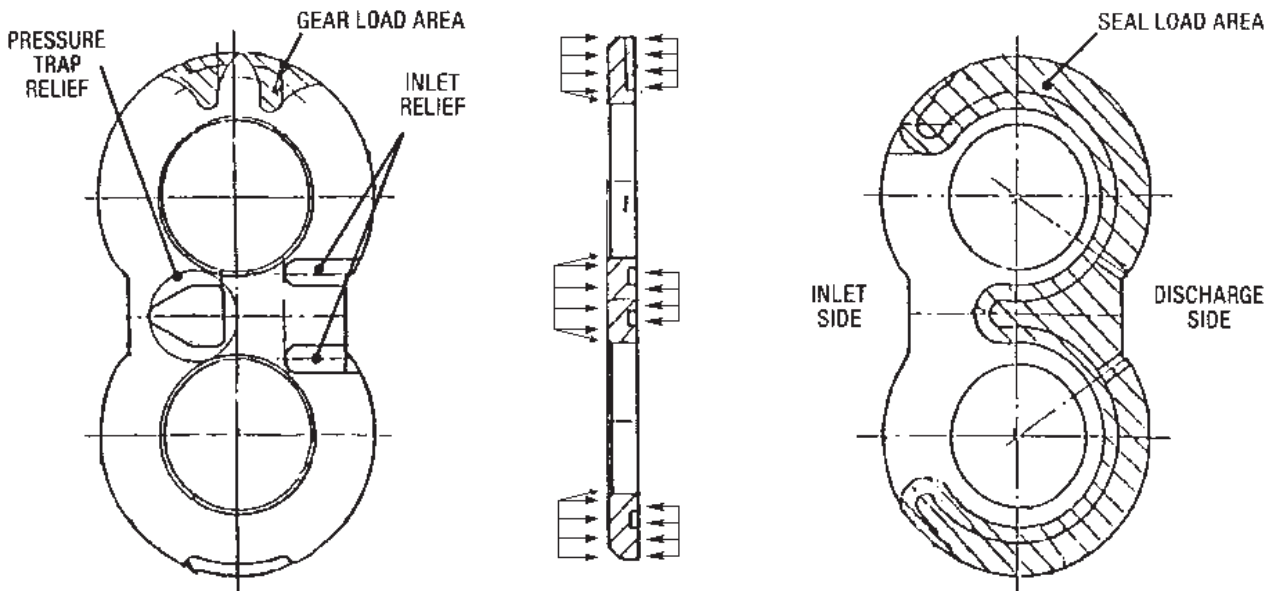

the meshing gear teeth, channels in the bearing blocks permit relief of the trapped fluid to the suction side of the pump.

The thin pressure balance plates also separate the pressure balance from the bearing load, thus permitting the pressure plates to function independently of bearing load. This permits the balance plates to accept higher radial loading and some loading in either direction. Running clearances are maintained tight enough to minimize leakage across the gear faces, yet sufficient to maintain the oil film between mating surfaces for minimum wear. As pressure increases, the sealing efficiency increases proportionally.

Teflon impregnated D.U. bushings on all pumps and motor models provide infinite life within the design load range. Unlike antifriction bearings, D.U. bushings do not present a B10 life problem. Teflon and pressure lubrication contribute to an indefinite operating life as long as the system is properly maintained. See Figure 4.

The large bearing size provides adequate support under all normal operating conditions. Since the

Figure 3:

Technical Features, Continued

bushing blocks and gears are contained in the same housing section, self alignment is ensured. As a result, Sauer-Sundstrand gear pumps are capable of higher pressure and efficiency than many pumps of equal displacement

DRIVE CONDITIONS

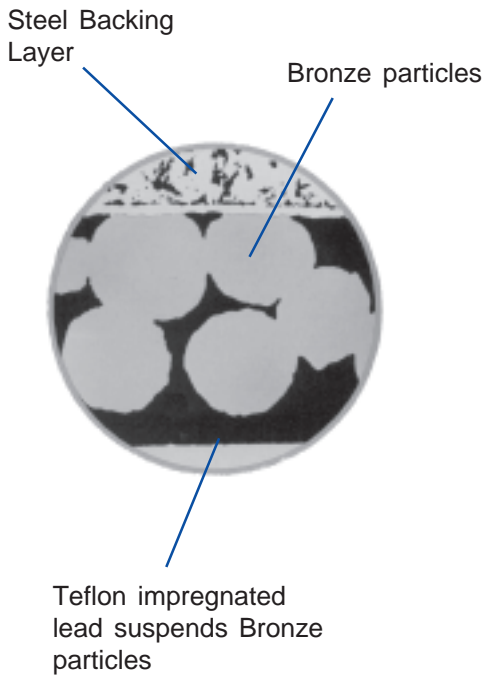

Most Sauer-Sundstrand gear products are available SAE standard spline or straight keyed drive shafts for direct or indirect drive applications. A three piece coupling is the preferred method of direct drives, thereby eliminating radial and axial loading.

Rigid splines may be used providing the mounting pilot should be aligned within .002 in. (.05 mm) on center [.004 (.10 mm) TIR].

Both concentricity and angular alignment of shafts are important to pump life. Misalignment can induce heavy side loads on bearing and seals, causing premature failure.

Overhung load drives (chain, belt, or gear) are permissible. Contact Sauer-Sundstrand for assistance.

Figure 4:
The DU® Bearing

DU® is a trademark of the Garlock Bearing Company

FILTRATION

A wire gauze strainer with a mesh opening of 90 micron (170 mesh) should be incorporated into the pump inlet line from the reservoir. The size of the suction strainer is determined by the limiting suction condition and must be correctly sized and cleaned on a regular basis to prevent cavitation.

A full flow 10 micron filter should be used in the system return line to trap all contaminants before they enter the reservoir.

Since the filter must be changed at regular intervals, the filter housing should be located in an accessible area.

OPERATING TEMPERATURES

With Buna seals and normal operating conditions, the system temperature should not exceed 180° F (82°C) except for short periods to 200° F (93° C).

With optional Viton elastomers, the system may be operated at continuous temperatures up to 225° F (107° C) without damage to the pump.

CAUTION: Operation in excess of 225° F may cause external leakage or premature unit failure.

FLUIDS

A mineral based fluid is recommended with additives to resist corrosion, oxidation and foaming. The oil should have the maximum viscosity commensurate with system pressure drop and pump suction levels. The viscosity at any running condition must be between 45 SSU minimum and 250 SSU maximum continuous.

Since the fluid used serves as a system lubricant, as well as transmitting power, careful selection of the fluid is important for proper operation of the unit and satisfactory life of the pump and components.

SUCTION

For maximum pump life, the inlet vacuum should not exceed 4 inches (100 mm) Hg . at the pump inlet. For cold start conditions, vacuum up to 12 inches (300 mm) Hg. is acceptable for short durations.

Both cavitation and the possibility of aeration increase with higher inlet vacuum. In addition, oil film lubrication is disrupted by high inlet vacuum. Both factors, either singularly or combined, may contribute to a decrease in pump life.

CAUTION: Continuous operation at vacuums in excess of 4 inches Hg. may cause premature unit failure.

Technical Features, Continued

MAXIMUM SPEED

Maximum speed is limited by gear tooth filling and surface speeds centrifugal gear teeth filling. Unless otherwise specified, maximum rated pump speeds listed in this manual are based on operation at sea level with SAE oil having a viscosity of 120 SSU at 122° (50° C). Speed limits for a particular application depend on inlet pressure and oil viscosity. Consult Sauer-Sundstrand for operation outside these limits.

MINIMUM SPEED

Minimum recommended operating speed, at rated pressure, varies from 480 RPM to 1100 RPM depending upon pump size. Minimum speed is limited by volumetric efficiency. If lower than recommended starting or operating speeds are required, contact Sauer-Sundstrand for assistance.

For motors, minimum speeds listed are for continuous operation at rated pressure. Motors may be started from zero speed on drives where torque typically increases with speed. Repeated starts under high load conditions are not recommended. No load start up pressures range from 300 to 600 PSI (20.7 to 41.4 BAR).

INPUT TORQUE RATINGS

The individual product dimensional configurations in this catalog list the maximum continuous input torques for various shaft options.

When applying pumps in tandem or multiple, observe that input torque limitations must be met for each section and cumulative sections.

Always insure that the rear pump on a tandem unit does not exceed its torque rating.

CAUTION: Torques in excess of those shown may cause premature input shaft or unit failure.

MOUNTING

The pump mount / drive should be designed to minimize axial and radial loads on the shaft. When using indirect (chain, belt, or gear) drive, contact Sauer-Sundstrand to determine permissible load limits and direction of installation.

PIPING

The choice of piping size and installation should always be consistent with maintaining minimum ve

locity. This will reduce system noise, pressure drops and overheating, thereby adding to cost savings for both the construction and operation of the system.

Inlet piping should be designed to prevent continuous pump inlet vacuums in excess of 4 in. (100 mm) Hg. or 12 in. (300 mm) Hg. during start-up when measured at the inlet port.

RESERVOIR

The reservoir should be designed to accommodate maximum volume changes during all system operating modes and prevent aeration of the fluid as it passes through the tank. Return and inlet lines should be positioned below the reservoir low oil level and be located as far as possible from each other. A baffle plate located between the pump inlet and return line is desirable to allow the oil to deaerate before it enters the pump.

Reservoirs are normally sized for at least one-half the maximum pump flow for adequate oil deaeration.

COOLING

Depending on duty cycle and reservoir/line construction, an oil cooler may be required. This is sized based on typical power losses in the hydraulic circuit. The oil cooler is usually placed in the return line.

CAVITATION

Hydraulic oil used in the majority of systems contains about 10% dissolved air by volume. This air under certain conditions of vacuum within the system is released from the oil causing air bubbles. These air bubbles collapse if subjected to pressure, and this collapse creates erosion of the adjacent metal. Because of this, it becomes obvious that the greater the air content within the oil, or the greater the vacuum in the inlet line, the more severe will be the resultant erosion.

The main causes of over-aeration of the oil are air leaks, particularly on the inlet side of the pump, and flow line restrictions such as inadequate pipe sizes, elbow fittings and sudden changes in flow line cross sectional area. Providing these defects are avoided; pump inlet pressure and rated speed requirements are maintained; and reservoir size and location is adequate, no cavitation problems should occur with Sauer-Sundstrand pumps and motors.

Technical Features, Continued

PRESSURE RATINGS

Sauer-Sundstrand pumps are designed to operate continuously at rated pressure. The maximum relief valve setting must be set above rated pressure and below peak pressure (relief valve overshoot). Lower operating pressure will extend the life of the unit.

PRESSURE PROTECTION

The pump, as well as other system components, has pressure limitations. Thus a relief valve must be installed in the system, preferably as close to the pump as possible, to protect it from excessive pressure. If the relief valve is set at or near the maximum pressure rating for the pump, the operating characteristics of the valve should be known so that common relief valve overshoot does not allow system pressure to exceed the pump rating.

CAUTION: Failure to install this relief valve may result in premature unit failure.

PRESSURE RATINGS

Sauer-Sundstrand pumps are designed to operate continuously at rated pressure. The maximum relief valve setting must be set above rated pressure and below peak pressure (relief valve overshoot). Lower operating pressure will extend the life of the unit.

LIFE EXPECTANCY

All Sauer-Sundstrand gear pumps utilize pressure balanced journal bearings which have an oil film maintained between the gear / shaft and bearing surfaces at all times. If this oil film is sufficiently sustained through proper system maintenance and operating limits are adhered to, a high life can be expected.

NOTE: A B-10 type life expectancy number is generally associated with anti-friction bearings and does not exist for journal bearings.

Type Designation and Order Code, SNP3

A: SERIES

SNP 3

B: DISPLACEMENT

- 22 = 22.1 cm³(1.35 in³)
- 26 = 26.2 cm³(1.60 in³)
- 33 = 33.1 cm³(2.02 in³)
- 38 = 37.9 cm³(2.32 in³)
- 44 = 2.69 cm³(2.69 in³)
- 48⁽¹⁾ = 48.3 cm³(2.93 in³)
- 55⁽¹⁾ = 55.1 cm³(3.36 in³)
- 63⁽¹⁾ = 63.4 cm³(3.87 in³)
- 75⁽¹⁾ = 74.4 cm³(4.54 in³)
- 90⁽¹⁾ = 88.2 cm³(5.38 in³)

Note: ⁽¹⁾only available in SNP3

E: Rotation

- D = Right (Clockwise)
- S = Left (Counterclockwise)

Order Example: SNP3 / 22 D SC 07E

Single gear pump SNP 3, displacement = 1.35 in³ (22.1 cm³) , clockwise rotation, splined shaft, SAE "B" 2 bolt mounting flange, SAE O-ring ports.

F: Special Options

- E = SAE O-Ring Boss (SNP3 only)
- F = BSP Threaded Ports, B.S.P.
- A = SAE code 61 ports on other than 07 code pumps (such as 11 code rear section for tandem)

E: Mounting Flange

- 01 } 4 bolt DIN mounting flange
- 02 }
- 03 }
- 06 }

- 07 = SAE "B" 2 bolt flange
- 11 = Flange code for Rear Section of Tandem

D: Drive Shaft

- CI = Straight Keyed Shaft With Key
- CO = Tapered shaft with key
- SC = Splined Shaft

NOTE: Refer to Configuration Dimensional detail on pages 17-21

Hydraulic Power Systems

SAUER-SUNDSTRAND Hydraulic Power Systems - Market Leaders Worldwide

SAUER-SUNDSTRAND is a world leader in the design and manufacture of Hydraulic Power Systems. Research and development resources in both North America and Europe enable SAUER-SUNDSTRAND to offer a wide range of design solutions utilizing hydraulic power system technology.

SAUER-SUNDSTRAND specializes in integrating a full range of system components to provide vehicle designers with the most advanced total-design system.

SAUER-SUNDSTRAND is Your World Source for Controlled Hydraulic Power Systems.

 <p>Heavy Duty Axial Piston Pumps and Motors</p>	 <p>Heavy Duty Bent Axis Variable Motors</p>	 <p>Cartridge Motors/ Compact Wheel Drives</p>
 <p>Medium Duty Axial Piston Pumps and Motors</p>	 <p>Mikrocontrollers and Electrohydraulic Controls</p>	 <p>Hydrostatic Transmissions Packages</p>
 <p>Open Circuit Axial Piston Pumps</p>	 <p>Gear Pumps and Motors</p>	 <p>Genuine Service Parts</p>

Worldwide Service Support

SAUER-SUNDSTRAND provides comprehensive worldwide service for its products through an extensive network of Authorized Service Centers strategically located in all parts of the world.

Look to SAUER-SUNDSTRAND for the best in WORLDWIDE SERVICE.
